## Overview

Composed Pages in EnterpriseOne are customizable pages that you can design using your own layout, without needing any HTML coding skills. They provide a unified user experience by allowing you to access multiple types of content and applications from a single page, making it easier to organize all the information you need in one place.

Composed Pages let you arrange content both vertically and horizontally within a single browser window. Each page can include one or more content areas (frames), which you can resize during use or expand to a maximized view.

## Benefits

### 1. Centralized access to information

Composed Pages bring multiple applications, reports, and content together in one place. This reduces the need to switch between screens and helps you work more efficiently.

### 2. No coding required

You can design and customize pages without HTML or technical expertise. This makes it easier for business users—not just developers—to create useful workspaces.

### 3. Personalized layouts

Users can arrange content in a way that fits their workflow, placing the most important information front and center.

### 4. Improved productivity

By displaying multiple data sources at once, Composed Pages allow quicker decision-making and reduce time spent navigating through the system.

### 5. Flexible and interactive interface

Content can be resized, rearranged, or maximized during runtime, giving users control over how they view and interact with information.

### 6. Seamless navigation

Switching between embedded applications is smooth, without opening new windows or tabs, which creates a more streamlined experience.

## Composed Pages Content Types

You can create Composed Pages with different content types. You can create them for your own use, view one's other users have created, or share yours so others can view and use them. Your ability to perform any of these tasks depends on the permissions you and others have been granted by your administrator.

### Designer Pane

The Designer Pane provides a quick and easy access to frequently used components such as EnterpriseOne applications, batch versions, tasks, Watchlist items, and more. In Page Composer, the Designer Pane is represented as a grid to which you can add various components. This pane is like a canvas on which you can create a process flow.

### One View Report

One View Reports provides an intuitive, easy-to-use interface for you to access and run existing reports that contain tables, graphs, and charts.

You can add **only one** One View Report content to a given Composed Page. Once you choose to add One View Report content, that option is not available again in the Content Type pop-up menu.

### EnterpriseOne Application Form

You can add an EnterpriseOne application form to a Composed Page. An EnterpriseOne application form is a page in which you can enter and retrieve data. Application might have several forms.

You can embed any EnterpriseOne application form on a Composed Page.

Message forms such as warning messages and sub forms cannot be embedded on a Composed Page. You can embed multiple EnterpriseOne forms on one Composed Page.

Standard security applies to all EnterpriseOne forms on the Composed Page. If you are secured out of a specific EnterpriseOne form, you cannot access it on the Composed Page.

## Classic Page

Classic pages are EnterpriseOne pages that enable you to work on multiple EnterpriseOne applications. They are HTML files, and can contain any HTML-enabled functionality, such as interactive process flows, URL links and web pages, company logos, etc. You must be proficient in coding HTML to configure or create Classic Pages.

## URL

This content type enables you to embed the content of a web page in a Composed Page. In the Page Composer, you use the web page content the same way as when you access the web page typing a URL in a web browser address bar.

## ADF Application

You can add an EnterpriseOne ADF (Application Development Framework) application to a Composed Page. ADF applications are a type of application intended to enhance the user experience using Oracle ADF technology.

You can add **only one** ADF application content to a given Composed Page. Once you choose to add an ADF application content, that option is not available again in the Content Type pop-up menu.

## OBIEE

You can add an OBIEE (Oracle Business Intelligence Enterprise Edition) object to a Composed EnterpriseOne Page. OBIEE is a comprehensive suite of enterprise BI products that delivers a full range of analysis and reporting capabilities along with a unified, highly scalable and modern architecture.

Oracle Business Intelligence Enterprise Edition (OBIEE) content frames provide users quick access to Oracle Business Intelligence information.

OBIEE content frames are available on the Composed EnterpriseOne Page only when OBIEE and the Oracle BI Applications Adapter for EnterpriseOne are installed and setup for your environment.

### Watchlist Pane (9.2.0.3)

When adding a watchlist pane to your composed page you have multiple options:

#### All Watchlists

Select this option to add a new Watchlist Pane which displays all the personal and shared Watchlists that are currently available to you.

#### Empty Watchlist

Select this option to add a new Watchlist Pane with no Watchlists. You can choose to add Watchlists to the pane from the content frame.

#### Dynamic Watchlist

Select this option to add a new Watchlist Pane with all the personal and shared Watchlists that are available to you. The Watchlists displayed in the pane cannot be modified but are dynamically determined during runtime for the Composed EnterpriseOne Page. When a dynamic Watchlist Pane is shared with other users, only those Watchlists will be displayed in the content frame for which the users have permission.

You can add **only one** Watchlist Pane to a given Composed EnterpriseOne Page.

### Springboard Pane (9.2.1)

A Springboard Pane consists of a collection of tasks available to a role.

The tasks launched from the Springboard Pane can be EnterpriseOne applications, batch programs, ADF applications, and One View Reports. When you launch a task item from the Springboard Pane, the system opens the associated application in a separate frame and launches a springboard at the top of the form.

The Springboard Pane uses menu indexing to determine the correct set of task items to be displayed for a role. If a role is restricted from accessing a certain task folder through Menu Filtering, then no tasks will be displayed on the Springboard Pane.

### Menu Pane (9.2.4.3)

The Menu Pane enables you to navigate to EnterpriseOne menus or favorites on a Composed Page. You can select a Task Folder or Favorites to select a task from the EnterpriseOne Favorites folder.

If a role is restricted from accessing a certain task folder through Menu Filtering, then no tasks will be displayed on the Menu Pane.

### Widget Pane (Release 9.2.9.4)

Using EnterpriseOne Widgets, you can create, publish, and visualize data that an orchestration can produce. EnterpriseOne Widgets evolve the concept of One View Watchlists by allowing the source of data to come from orchestration output.

Personal Widgets, as well as the shared Widgets that are available to you, can be added to the Widget Pane of the Composed EnterpriseOne Page.

### Enterprise Process Pane (Release 9.2.26.0)

The Enterprise Process Pane enables you to add the enterprise processes on the Composed Page.

Using the Enterprise Process Pane, you can choose from a set of user generated enterprise process UDOs, visualize a graphic of the process model, visualize KPIs, metrics and measurements that apply to nodes and connections within the process model, and other functions.

Personal enterprise processes, as well as the shared processes that are available to you, can be selected from the Select Process drop-down list in the Enterprise Process Pane of the Composed EnterpriseOne Page.

## Lecture Composed Pages & Panes

You want to learn the details about each single Tile Type and how to use it:
